PART 1

INTRODUCTION

Welcome to *The Pocket Pipeline*. This very small book exists for one reason: to prove that Markdown can flow through Pandoc and Typst and come out the other side as a print-ready PDF for Kindle Direct Publishing.

The body text is set in Libertinus Serif and justified, with hyphenation, so the right margin stays even—just as it should in a real book. Notice that the first line of a chapter’s opening paragraph is *not* indented, while the paragraphs that follow it are.

1

WHAT THIS DEMONSTRATES

A few ordinary things every manuscript needs:

- multiple paragraphs with first-line indents,
- an unordered list (this one),
- an ordered list, and
- the occasional footnote.¹

And the same content as an ordered list:

1. Write in Markdown.
2. Run the build.
3. Upload the interior PDF to KDP.

Ready to try it? Exercise #1 — clone the repository, run the build, and open the PDF. You will do the fuller version in [Exercise #2](#) at the end of the next chapter.

Exercises like the one above are numbered automatically, and every one is collected in the *List of Exercises* at the back. Notice that the reference to [Exercise #2](#) already knows its number, even though we have not reached it yet.

A blockquote, for those moments when a book wants to quote itself.

¹Footnotes land at the foot of the page, where they belong.

PART 2

ON TYPOGRAPHY

Good typography is mostly invisible. The reader notices a *bad* line break or a cramped margin, but rarely a good one.

WHY A BINDING GUTTER MATTERS

In a printed book the inside margin must be wider than the outside, because the binding swallows part of each page. KDP rejects interiors that ignore this, which is exactly why this pipeline sets an asymmetric **gutter** rather than symmetric margins.

SURVIVING THE TRIP

This second section exists so the table of contents has more than one entry per chapter. It also confirms that **bold** and *italic* survive the journey from Markdown all the way to the printed page.

Exercise #2 — build the print output and upload the interior PDF to a KDP draft (you need not actually publish it). Then look back at [Exercise #1](#) to see how far you have come. In the printed book that reference carries the page number; on screen it is a live link.
